ICT Literacy and Utilization in Teaching Social Studies among Private Secondary Schools in Valencia City

Aaron G. Apuya,* Angelina A. Cacharo

For affiliations and correspondence, see the last page.

Abstract

This study determined the level of Teachers' ICT Literacy and the utilization of ICT in teaching Araling Panlipunan among teachers of Private Secondary Schools of Valencia City for the school year 2020. Specifically, this study sought to describe the respondents' demographic profile in terms of; age, gender, marital status, years in teaching Social Studies/Araling Panlipunan, total teaching hours per week, and the available ICT Resources. Determine the ICT literacy of the respondents in terms of General Computer Usage and Online Communication. Find out to what extent they use ICT to teach Social Studies/ Araling Panlipunan. Determine the significant relationship between the teachers' ICT literacy level and their utilization of ICTs in teaching Social/Araling Panlipunan and to ascertain the significant difference in the teachers' ICT level when group according to respondent's age, gender, marital status, ICT years of teaching, teaching hours per week and available ICT resources? This study used a descriptive-correlation research method which was designed for the researchers to gather information about present existing conditions needed in the chosen field of the study. It was conducted among private schools of the municipality of Valencia City offering Junior and Senior High Schools for this school year 2019-2020; namely: Infant Jesus School of Bukidnon, Valencia Baptist Christian Academy, San Augustine Institute of Technology, IBA College of Mindanao, Philippine College Foundation, First Fruit Academy, Seventh Day Adventist, STI, AMA and Academy, and Valencia Colleges Incorporated. The respondents of the study are secondary school teachers of Private Schools teaching Social Studies/Araling Panlipunan in Junior and Senior high school. This study employed a purposive or take-all method. Descriptive statistics were employed in this study such as frequency count and percentage, weighted mean and standard deviation, Pearson r, and regression analysis were used. It was revealed in this study that the majority of respondents are females and the majority of them are singles. The majority of respondents have 4-10 years of teaching the majority of teacher respondents have 16-20 hours of teaching per week. There was a Very High Level in terms of hours per week and the Majority have their own personal laptop, a Very High level of ICT literacy in General Computer Usage and Online Communication. A Very High Extent in the Utilization of ICT in Teaching Araling Panlipunan. There was a Significant Relationship between teachers' ICT literacy level and utilization in teaching Araling Panlipunan. Therefore, the null hypothesis is rejected. There was a significant difference in the teacher's ICT level when grouped according to respondent's age, gender, marital status, ICT years of teaching, teaching hours per week, and available ICT resources, therefore a statement of the null hypothesis is rejected.

Keywords: *ICT literacy, utilization, teaching social studies, private secondary schools*

Introduction

ICTs can increase the learner's motivation and engagement in the teaching learning process. It equips learner with digital age literacy, inventive thinking, higher ordered thinking skills sound reasoning, effective communication and high productivity (Tinio, 2002). When teachers are digitally literate and trained to use ICT, this approach can lead to higher ordered thinking skills, provide creative and individualized option for students to express, their understanding and lead student better prepared to deal with ongoing technological change in society and their workplace.

Information Communication Technology (ICT) Literacy is the ability to use computer skills and to communicate effectively using various technology tools. These skills are needed to teachers nowadays to prepare this lifelong learner who need to have compassionately enabled-mind, confidently and digitally aware community as the world is braced by the so-called Information Communication Technology (ICT) Technology Proficiency is but one dimension of teacher's competence, as stated by Akram (2010). The computer proves an excellent tool for the teaching and learning of school subjects. Oyadeco & Tella (2009).

Information and communication Technology includes any digital communication devices, tools or application that influence most of the people's activity in progression. Adeyemo (2010) described ICT as consisting of computer hardware, software, network and media for the collection, storage, processing, transmission and presentation of information.

Today's rapid technological changing milieu requires the principal and teachers as a technology leader to become involve in discovering, evaluating, installing, and operating new technologies of all kind, while keeping teaching and student learning as the guide and driving force beyond it all (Gao et al, 2010) Thus undeniably, ICT greatly contribute positive outcome in everyday life. However, in this study it was found out that there was poor utilization of ICT in evaluation of learning by the teachers. Through different ICT related programs like the recent DepEd Computerizations Program (DCP) that aims to provide public schools with appropriate technologies that would enhance the teaching-learning process and meet the challenges among private schools in the teaching learnings

of the 21st Century. It is mandated that all education institution educators will see ICT as a teaching and learning device across all education institution.

Social Studies or Araling Panlipunan is one of the Core subjects in the basic education curriculum that critically needs large ICT integration in carrying lessons and conveying history and facts, and bringing student into virtual environment, which ICT literacy of teachers are highly needed to bring such learning into reality. But the nature, Value and availability of information has changed enormously, and this change impacts the way teachers and learners live, learned and work. It is not just enough to master technical skills in order to succeed but person must know how to apply them with in information society. There is lack of information about the ICT literacy of students, and debate about how best to address this issue in academic curriculum.

IPCRF Individual Performance Commitment Review form for teachers one performance indicator stipulates under the delivery of basic education services and during the teaching learning process the facilitating and engaging of ICT during classroom instruction, thus measuring the ICT literacy level of teachers and utilization in teaching may identify the needs of improvement and delivering and using ICT in the teaching and Learning Process. This study is designed to measure the ICT Literacy level of teachers, the ICT utilization in teaching, and the available ICT resources used by teachers in teaching Social Studies or Araling Panlipunan.

Research Questions

This study determined the level of Teachers ICT Literacy and the utilization of ICT among teachers of Private Secondary Schools of Valencia City for school year 2020 teaching social studies. Specifically, this study sought to answer the following questions:

1. What are the respondents' demographic profile in terms of; age, gender, marital status, years in teaching Social Studies/ Araling Panlipunan, total teaching hours per week, and the available ICT Resources?
2. What is the ICT literacy level of the respondents in terms of General Computer Usage and Online Communication?
3. To what extent do they use ICT in teaching Social Studies/ Araling Panlipunan?
4. Is there a significant relationship between the teachers' ICT literacy level and their utilization of ICTs in teaching Social studies? Araling Panlipunan?
5. Is there a significant difference in the teachers' ICT level when grouped according to respondent's age, gender, marital status, ICT years of teaching, teaching hours per week, and available ICT resources?

Methodology

Research Design

This study was a descriptive correlation method of research which is appropriate to allow two variables to illustrate either a positive or negative relationship. Essentially, patterned survey questionnaires from DepEd CICT ICT4BE project and survey of schools. ICT and European Commission is utilizing as primary source in determining the level of teachers' ICT Literacy and the extent of utilizing ICT in teaching Social Studies/Araling Panlipunan.

Respondents

The respondents of the study were secondary school teachers of Private Schools teaching Social Studies/Araling Panlipunan from Junior High School to Senior High School in Valencia City for School Year 2020. This study used purposive sampling since all teachers teaching social studies/ Araling Panlipunan in Junior and Senior High School among private schools in Valencia City were taken as respondents of the study.

Instrument

This study was adapted, the instrument patterned from a survey DepEd CICT ICT4BE project and survey of schools: ICT and education, European consisting 3 parts , part I focused on teachers' demographic profile which includes age, marital status, years in teaching , hours per week as well as available ICT resources , while part II had two sections were used to extract information on the teachers' ICT Literacy Level in terms of General computer Usage and online Communication and lastly, part III was intended to identify the extent of utilization of ICT in teaching Social Studies/ Araling Panlipunan. The researcher did not validate the instrument since this was tested, validated and proven its reliability being adapted from Jamero (2017).

In measuring three level of respondents' ICT Literacy and the extent of ICT utilization in Social Studies/ Araling Panlipunan, the Likert scale scoring procedure was employed as follows:

Table 1. *Likert scale scoring*

Scale	Interval	Qualitative Description	
5	4.21-5.00	VHL	Very High Level
4	3.41- 4.20	HL	High Level
3	2.61- 3.40	ML	Moderate Level
2	1.80- 2.60	LL	Low Level
1	1.0- 1.80	VLL	Very Low Level

Data Analysis

The researcher employed mean frequency count and percentage for analyzing the teachers' demographic profile and available resources. While measuring the Teachers' ICT Literacy level in general computer Usage and online communication as well as the extent they use ICT in teaching, computing the mean and standard deviation had been used. In quantifying and determining the relationship between the Teacher's ICT Literacy Level and utilization, Person r Product Moment Correlation coefficient was implied and lastly, in determining the significant difference on the teachers' ICT Literacy Level when grouped according to its intervening variables, t-Test and ANOVA were generated.

Results and Discussion

This section presents the presentation of results as well as the analysis and interpretation in the light of educational research.

Respondents' Demographic Profile in terms of Age, Gender, Marital Status, No. of Years in teaching, Teaching Hour per week and Available ICT Resources

Table 2. *Respondent's Demographic Profile in terms of Age.*

Age	Freq	Percent
Under 25 – 30	32	59.3
From 30 to 39	17	31.5
From 40 to 49	5	9.3
50 or more	0	0
Total	54	100

As shown that majority of the respondents' age were under 25 – 30 years old (freq = 32 or 59.3%). The distribution was followed by ages between 30 – 39 years old (freq = 17 or 31.5%). It can be noticed that the least in the respondents' age were ages between 40 – 49 years old. This means that most teachers employed in private schools belongs to the middle age, ages under 25-30 years old with the frequency of 32 or 59.3 percent. Philip (2009) Studied on Age and ICT-related behaviors of higher education in Nigeria. The study examined ICT attitude, competence, and use pattern of teacher educators. It also examined the effect of age of educators on time used in interacting with ICT. Findings revealed that age is not a factor when considering the attitudes, competence and use pattern of teacher educators. In addition, age was not found to affect the time used on ICT by higher education teachers in Nigeria.

The respondents' profile in terms of marital status. It has two categories, male and female. The frequency and percent are presented.

Table 3. *Respondent's demographic profile in terms of gender.*

Gender	Freq	Percent
Male	21	38.9
Female	33	61.1
Total	54	100

Table 3 shows that majority of the respondents were female (freq = 33 or 61.1%). Males (freq = 21 or 38.9%) comprised the minority of the distribution. This means that the teachers employed in private school are mostly females that comprise 33 or 61.1%. The role of literacy and numeracy were found to be existing gender norms, and the increased opportunities stemming from higher levels of education included broader social networks, enhanced employability, and increased mobility.

Table 4. *Respondent's demographic profile in terms of marital status.*

Marital Status	Freq	Percent
Single	33	61.1
Married	20	37.0
Widowed	1	1.9
Separated	0	0
Total	54	100

Table 4 shows that majority of the respondents were single (freq = 33 or 61.1%). The distribution was followed by married (freq = 20 or 37.0%). It can be observed from the table that there is a respondent who was widowed (freq = 1 or 1.9%). This means that most teachers worked in private schools are single with the frequency of 33 or 61.1% According to Bandura (1989), there is a triadic relationship among personal factors such as marital status, environmental factors such as the teaching profession and behavioral characteristics such as self-efficacy. Islahi and Nasreen (2013) study found that the influence of marital status on teachers' effectiveness was significantly different between the married and unmarried teachers.

The respondent's demographic profile in terms of years in teaching social studies. The categories are less than 1 year, 1 – 3 years, 4 – 10 years, 11 – 20 years, 21 – 30 years and more than 30 years. The frequency and present are presented.

Table 5. *Respondent's demographic profile in terms of years in teaching social studies.*

<i>Years of teaching</i>	<i>Freq</i>	<i>Percent</i>
Less than 1 year	14	25.9
1 – 3 years	15	27.8
4 - 10 years	19	35.2
11 – 20 years	6	11.1
21 – 30 years	0	0
More than 30 years	0	0
Total	54	100

Table 5 shows that majority of the respondents were teaching Social Studies between 4 – 10 years (freq = 19 or 35.2%). Some were teaching the subject less than a year (freq = 14 or 25.9%) and 1 – 3 years (freq = 15 or 27.8%). There were few of them who were already 11 – 20 years (freq = 6 or 11.1%) in teaching Social Studies. This means that most teachers in the private schools are at 4-10 years with a frequency of 19 or 35.2%. Experience matters, but more is not always better. The impact of experience is strongest during the first few years of teaching; after that, marginal returns diminish. Teachers show the greatest productivity gains during their first few years on the job, after which their performance tends to level off. A study using New York City data illustrates the diminishing marginal returns to experience (Boyd et al. 2007).

The respondents' demographic profile in terms of teaching hours per week. The categories were fewer than 10 hours, 10 – 15 hours, 16 – 20 hours, 21 – 25 hours and more than 25 hours. The frequency and percent are shown.

Table 6. *Respondents' demographic profile in terms of teaching hours per week.*

<i>Teaching Hours Per Week.</i>	<i>Freq</i>	<i>Percent</i>
Fewer than 10	14	25.9
10 – 15 hours	14	25.9
16 – 20 hours	16	29.6
21 – 25 hours	10	18.5
More than 25 hours	0	0
Total	54	100

Table 6 shows that the number of the teachers with teaching hours of fewer than 10 hours (freq = 14 or 25.9%) and 10 to 15 hours (freq = 10 – 15 hours or 25.9%) are the same. The teachers with teaching hours of 16 – 20 hours (freq = 16 or 29.6%) were majority of the respondents. The table reveals further that the teachers whose teaching hours were 21 – 25 hours (freq = 10 or 18.5%) were minority of the distribution. This means that teachers in private have mostly spending 14 to 16 hours per week in teaching. This supports Gwambombo (2013) revealed that the teachers' workload in community secondary schools was heavy and affect students' academic performance negatively. From the findings the heavy teachers' workload is due to large number of periods taught by one teacher per week. Likewise, constructing, administering, scoring, analyzing, and marking internal tests also exercises in classes which are overcrowded. Furthermore, administrative roles performed by teachers in community secondary schools increase their workload and affect students' academic performance negatively. Due to increased teachers' workload in community secondary schools, students performed poorly in their continuous assessments.

The demographic profile of the respondents in terms of available ICT resources. The ICT resources that were considered are: Personal Laptop, School Laptop, Smartphones, Internet Connection, Computers without Internet Connection, Computers with Internet Connection, E-Classroom or Computer Laboratory, LCD Projector and others. The frequency and percent are shown.

Table 7. *Respondent's demographic profile in terms of available ICT resources.*

<i>ICT Resources.</i>	<i>Freq</i>	<i>Percent</i>
Personal Laptop	44	81.5
School Laptop	8	14.8
Smartphones	0	0
Internet Connection	1	1.9
Computers without Internet Connection	0	0
Computers with Internet Connection	0	0
E-Classroom or Computer Laboratory	1	1.9
LCD Projector	0	0
Others	0	0
Total	54	100

Table 7 shows that majority of the respondents had personal laptops (freq = 44 or 81.5%). Few had school laptops (freq = 8 or 14.8%). There was a respondent who had internet connection (freq = 1 or 1.9%) and other 1 who had e-classroom or computer laboratory. This means that laptop for teachers now a day is the most essential equipment in teaching and part of their life routine in teachers teaching

existence. Correos, C. (2014) conducted a research study relative to the ICT utilization on Language teaching revealed that English language teachers considered insufficient resources, lack of time in preparing lessons using technology, lack of ICT training, as the most dominant challenges that prevent them from using ICT in language teaching. That's the main reason why beginning in 1996, the Department of Education (DepED) embarked upon an undertaking that would provide computers to all public secondary schools in the country.

The ICT literacy of the respondents in terms of general computer usage. There are 30 indicators in which their corresponding means standard deviations (SD and qualifying statements are presented.

Table 8. *ICT literacy of the respondent's in terms of general computer usage.*

Indicator	Mean	SD	Qualifying Statement
1. Log-in to the computer	4.81	.392	Very High Level
6. Log off and turn off computer	4.81	.392	Very High Level
2. Save work in a hard drive	4.80	.407	Very High Level
4. Locate class files	4.74	.483	Very High Level
5. Locate instructional files	4.72	.529	Very High Level
7. Print files	4.69	.609	Very High Level
3. Locate software	4.67	.644	Very High Level
8. Print document using printer attached to the computer	4.61	.656	Very High Level
15. Delete and rename files	4.61	.627	Very High Level
16. Move a file from a hard drive to a USB drive	4.56	.718	Very High Level
14. Move unwanted files into my recycle bin and delete the permanently from my hard drive	4.52	.693	Very High Level
9. Print a document using a shared printer	4.52	.693	Very High Level
17. Use "search" command to locate file	4.46	.770	Very High Level
12. Navigate through files and directories	4.44	.718	Very High Level
13. Organize, copy and paste files in directories	4.44	.718	Very High Level
22. Create a basic word document	4.39	.811	Very High Level
23. Format document's font and paragraph (e.g. bold, spacing, style, alignment, etc.)	4.39	.738	Very High Level
24. Insert a different material in illustration group (e.g. table, charts, shapes, pictures, etc.)	4.37	.760	Very High Level
10. Print a document using a network printer	4.35	.756	Very High Level
18. Install a software program	4.35	.805	Very High Level
19. Scan disks for viruses	4.35	.828	Very High Level
11. Change printer parameters like page numbers, paper orientation, margins and proportions, etc.	4.33	.847	Very High Level
26. Apply advance skills like formatting cells and formulas	4.33	.644	Very High Level
21. Naming parts of MS Word, excel and PowerPoint window	4.31	.773	Very High Level
28. Create and insert hyperlinks in your presentation to make navigational links	4.30	.768	Very High Level
20. Write files on CD or DVD	4.28	.811	Very High Level
27. Create presentation using PowerPoint	4.26	.620	Very High Level
25. Create basic excel spreadsheet	4.22	.691	Very High Level
30. Edit pictures or images using picture editor applications	4.22	.883	Very High Level
29. Insert videos, images and audios in your presentation	4.17	.863	High Level
Overall	4.47	.551	Very High Level

Legend: 5 (4.21–5.00) – Very High Level; 4 (3.41–4.20) – High Level; 3 (2.61–3.40) – Moderate Level; 2 (1.81–2.60) – Low Level; 1 (1.00–1.80) – Very Low Level.

Table 8 shows that 29 of the indicators were in very high level literacy of the respondents. The indicators "Log-in to the computer" (mean = 4.81, sd = .392) and "Log off and turn off computer" (mean = 4.81, sd = .392) had the highest means. It is important to mention that the indicators "Insert a different material in illustration group (e.g. table, charts, shapes, pictures, etc.)" (mean = 4.37, sd = .760), "Print a document using a network printer (mean = 4.35, sd = .756), "Install a software program" (mean = 4.35, sd = .805), "Scan disks for viruses" (mean = 4.35, sd = .828) were in very high level of literacy. the four indicators, "Change printer parameters like page numbers, paper orientation, margins and proportions, etc." (mean = 4.33, sd = .847), "Apply advance skills like formatting cells and formulas" (mean = 4.33, sd = .644), "Naming parts of MS Word, excel and PowerPoint window" (mean = 4.31, sd= .773) and "Create and insert hyperlinks in your presentation to make navigational links" (mean = 4.30, sd = .768) were in the very high level of respondents' literacy as well. The indicator "Insert videos, images and audios in your presentation (mean = 4.17, sd = .863) was in high level of literacy by the respondents. In overall, the ICT literacy of the respondent's in terms of general computer usage (mean = 4.47, sd = .551) was in very high level. This means that majority teachers of private schools are ICT literate in terms of computer usage. Information and Communication Technologies (ICTs) are indispensable tools in the transmission of knowledge and have been accepted as viable means of communication in the contemporary world. ICT facilities in this study are instructional equipment and services which make teaching and learning processes to be done electronically and provide access to a wide range of innovation, information and educational materials on the internet in order to bring the world into the classroom. Effective utilization of ICT facility for instructional process reinforces the teachers' ability to cater for individual differences and fosters learners' involvement, participation

and understanding, which help them in grounding their thoughts and feelings and in turns contribute to good academic performance in schools.

The ICT literacy of the respondent's in terms of general online communication. The mean, sd and qualifying statement are shown.

Table 9. *ICT literacy of the respondent's in terms of general online communication.*

Indicator	Mean	SD	Qualifying Statement
6. Use search engines to locate desired information from the internet	4.46	.636	Very High Level
8. Understand the copyright restrictions apply to computer software and internet documents	4.44	.572	Very High Level
5. Understand and apply basic email etiquette	4.41	.659	Very High Level
7. Download and save files from web	4.41	.659	Very High Level
9. Collaborate online with students	4.39	.627	Very High Level
10. Communicate online using social media sites	4.30	.603	Very High Level
2. Create and activate my e-mail account (e.g. Yahoo, Gmail, etc.)	4.28	.763	Very High Level
3. Compose, send, receive, reply to and forward to and forward e-mail messages	4.26	.805	Very High Level
4. Attach/remove documents to/from email messages	4.26	.805	Very High Level
1. Use the browser basic commands to surf the internet	4.24	.751	Very High Level
Overall	4.34	.581	Very High Level

Legend: 5 (4.21–5.00) – Very High Level; 4 (3.41–4.20) – High Level; 3 (2.61–3.40) – Moderate Level; 2 (1.81–2.60) – Low Level; 1 (1.00–1.80) – Very Low Level.

Table 9 shows that the respondent's ICT literacy of the respondent's in terms of general online communication in all indicators were in very high level. The "Use search engines to locate desired information from the internet" (mean = 4.46, sd = .636) had the highest mean value while the "Use the browser basic commands to surf the internet" (mean = 4.24, sd = .751) got the lowest mean value. In general, the respondent's ICT literacy in terms of general online communication (mean = 4.34, sd = .581) was in very high level. This means that most private school teachers are updated on the technology usage with over all mean 4.34 described very High level in respond to general online Communication. Inversely to the study of Wanjala, Elizabeth. K and Mukwa (2011) found that few teachers are using ICTs to manage the classroom and to integrate technology into several of the content areas. Professional development options were varied. They pointed out the most teachers use trial and error, learn through course work taken at colleges or universities, and support others or receive personal or expert support as significant methods of learning how to use Information Communication and Technologies. Effective use of ICT facilities promotes high academic achievement as indicators of quality learning outcome (Yusuf, 2004) this also supported by Owolu, E.E (2016) in his study the positive correlations of ICT utilization and academic achievement.

The extent of using ict in teaching social studies/ Araling Panlipunan. The mean, sd, and qualifying statements are presented.

Table 10. *Extent of using ict in teaching social studies/ Araling Panlipunan*

Indicator	Mean	SD	Interpretation
4. Create your own digital learning materials for students	4.43	.633	Very High Extent
2. Browse/search the internet to collect resources to be used during lessons	4.41	.633	Very High Extent
3. Use applications to prepare presentations for lessons	4.39	.656	Very High Extent
5. Prepare exercises and tasks for students	4.39	.656	Very High Extent
6. Post home work for students on the school website or any website	4.39	.627	Very High Extent
8. Evaluate digital learning resources in the subject(s)	4.37	.623	Very High Extent
15. Use televisions to allow students watch current issues	4.37	.560	Very High Extent
7. Use ICT to provide feedback and/or assess students' learning	4.35	.648	Very High Extent
12. Look for online professional development opportunities	4.35	.649	Very High Extent
10. Download/upload/browse material from the website	4.33	.700	Very High Extent
13. Conduct class discussion in e-classroom	4.31	.577	Very High Extent
1. Browse/search the internet to collect information to prepare lessons	4.30	.662	Very High Extent
11. Download/upload/browse material from a learning platform	4.28	.656	Very High Extent
9. Communicate online with parents	4.26	.678	Very High Extent
14. Use electronic offline materials	4.26	.678	Very High Extent
Overall	4.35	.573	Very High Extent

Legend: 5 (4.21–5.00) – Very High Extent; 4 (3.41–4.20) – High Extent; 3 (2.61–3.40) – Moderate Extent; 2 (1.81–2.60) – Low Extent; 1 (1.00–1.80) – Very Low Extent.

Table 10 shows that the extent of using ICT in teaching social studies/ Araling Panlipunan base from all indicators was very high. The indicator "Create your own digital learning materials for students" (mean = 4.43, sd = .633) got the highest mean and the "Use electronic offline materials" (mean = 4.26, sd = .678) got the lowest mean. Browsing/searching the internet to collect information to prepare lessons (mean = 4.30, sd = .662) was in very high extent also. This means that majority of teachers in private schools utilize ICT in teaching Araling Panlipunan

Determining teachers' ICT literacy and describing their levels of technology utilization needs to be prioritized to address some of the problems currently affecting the Philippine educational system. Like strengthening the ICT resources in all schools in the country as Ayeni and Ogubameru, (2013) opined that ICT stands to improved teaching and learning, and secondary schools with very good ICT

resources achieved on the average, better results in teaching subjects in araling panlipunan than those with poor ICT resources.

The test of significant relationship between the teacher's ict literacy level and their utilization of ICT in teaching Social Studies/Araling Panlipunan.

Table 11. *Test of significant relationship between the teacher's ICT literacy level and their utilization of ICT in teaching Social Studies/Araling Panlipunan.*

Variable	r	P-value
General Computer Usage	.797(**)	.000
Online Communication	.733(**)	.000

The test of significant difference in the teacher's ICT level when group according to respondent's age.

Table 12. *Test of significant difference in the teacher's ICT level ICT literacy when group according to respondent's age.*

Variable	Mean	Brown – Forsythe ANOVA Stat	p-value
Under 25 – 30	4.68	6.826	.021
From 30 to 39	4.17		
From 40 to 49	3.80		
SSbetween = 5.168 MSbetween = 2.584			
SSwithin = 10.391 MSwithin = .204			

Table 12 shows that the means of teachers' ICT level of literacy when the respondents were grouped according to age had significant difference (BF stat = 6.826, p – value = .021). the significant differences were between the age groups of under 25 – 30 years old (mean = 4.68) and 30 – 39 years old (mean = 4.17).

This means that age differ on expertise in utilization of ICT in teaching araling Panlipunan. Most of young teachers are termed as digital native, as they appear in the world upon birth they are already associated with technology and as they grow, they used to it and live, worked and utilized this in teaching as part of routines.

The test of significant difference in the teachers' ICT level when group according to respondent's gender.

Table 13. *Test of significant difference in the teacher's ICT level of literacy when they are group according to respondent's gender.*

Age	Mean	t	P - value
Male	4.61	1.867	.068
Female	4.33		

Table 13 shows that there is no significant difference on the respondents' level of ICT literacy when grouped according to gender (t = 1.867, p – value = .068). this means that the level of ICT literacy of male and female respondents were the same.

The Test of significant difference in the teacher's ICT level when group according to respondent's marital status.

Table 14. *Test of significant difference in the teacher's ICT level when group according to respondent's marital status.*

Variable	Mean	F	p-value
Single	4.68	12.631	.000
Married	4.03		
Widowed	4.40		
SSbetween = 5.154 MSbetween = 2.577			
SSwithin = 10.405 MSwithin = .204			

Table14 shows that there is a significant difference in the ICT literacy of the respondents when they were grouped according to marital status (F – 12.631, p–value = .000). The difference in ICT literacy was among the three marital statuses: single (mean = 4.68), married (mean = 4.03); and widowed (mean = 4.40).

The results revealed further that the respondents who were single and widowed were more ICT literate than those who were widowed. This means that single and widowed have ample time in updating ICT technology this is simply understood that they don't have families to attend to so they can focus utilizing ICT in preparation for teaching in araling Panlipuban.

The test of significant difference in the teachers' ICT level when group according to respondent's years of teaching.

Table 15. *Test of significant difference in the teacher's ICT level when group according*

to respondent's years of teaching.

to Respondent's years of teaching:			
Variable	Mean	Brown – Forsythe ANOVA Stat	p-value
Less than 1 year	4.82	7.868	.003
1 – 3 years	4.64		
4 - 10 years	4.18		
11 – 20 years	3.85		
SSbetween = 5.983	MSbetween = 1.994		
SSwithin = 9.575	MSwithin = .192		

Table 15 shows that there is a significant difference on the ICT literacy of the respondents when they were grouped according to their years in teaching. Respondents who were young in teaching: less than 1 year (mean = 4.82) and 1 – 3 years (mean = 4.64) were more literate than those who already spent 4 – 10 years (mean = 4.18) and 11 – 20 years (mean = 3.85) in teaching

The test of significant difference in the teachers' level of ICT literacy in terms of teaching hours per week.

Table 16. Test of significant difference in the teacher's ICT level of literacy when group according to respondent's teaching hours per week.

teaching hours per week.			
Variable	Mean	F	p-value
Fewer than 10	4.84	8.434	.000
10 – 15 hours	4.61		
16 – 20 hours	4.10		
21 – 25 hours	4.17		
SSbetween =	MSbetween =		
SSwithin =	MSwithin =		

Table 16 shows that there is a significant difference in the respondents' ICT literacy when they were grouped according to their teaching hours per week ($F = 8.434$, p – value = .000). Teachers who had fewer teaching hours were more ICT literate than those who had more teaching hours, fewer than 10 hours (mean = 4.84), 10 – 15 hours (mean = 4.61), 16 – 20 hours (mean = 4.10), 21 – 25 hours (mean = 4.17). This is simply mean that lesser time spent in teaching more time and focus manipulating and updating ICT in the preparation of teaching lesson using the technology.

The test of significant difference in the teacher's ICT level when group according to respondent's available ICT resources.

Table 17. Test of significant difference in the teacher's ICT level when group according to respondent's available ICT resources.

according to respondent's available ICT resources.			
Variable	Mean	F	p-value
Personal Laptop	4.57	6.475	.001
School Laptop	3.82		
Internet Connection	3.72		
E-Classroom or Computer Laboratory	4.22		
SSbetween = 4.354	MSbetween = 1.451		
SSwithin = 11.205	MSwithin = .224		

Table 17 shows that there is a significant difference on the respondent's ICT literacy when they were grouped according to available ICT resources ($F = 6.475$, p – value = .001). those who had personal laptops (mean = 4.57) were more ICT literate than those who have School Laptop (mean = 3.82), Internet Connection (mean = 3.72) and E-Classroom or Computer Laboratory (mean = 4.22).

Therefore, the null hypothesis is rejected because there is a significant difference on the respondents' ICT literacy when they were grouped according to age, marital status, years in teaching, teaching hours per week and available ICT resources.

Conclusions

Majority of respondents were at the mid 50 years or most of them are singles and Majority has 4-10 years in teaching. It was revealed that majority of teacher respondents has 16-20 hours in teaching per week. There was a Very High Level in terms of hours per week and Majority have their own personal laptop, a Very High level on ICT literacy in General Computer Usage and online Communication.

A Very High Extent in utilization of ICT in teaching Araling Panlipunan. There is a Significant Relationship between teacher's ICT literacy level and utilization in teaching Araling Panlipunan. Therefore, null hypothesis is rejected. There is a significant difference in the teacher's ICT level when group according to respondent's age, gender, marital status, ICT years of teaching, teaching hours per week and available ICT resources, therefore statement of null hypothesis is rejected.

Secondary School teachers among private schools need to update the course component in computer education and motivate faculty of all subjects' teachers at every level to upgrade their knowledge and skills of using the ICT in utilization in teaching regardless of age,

gender and marital status and work experience.

Information and Communication Technology can be included as a core subject at Secondary Schools and College courses. The curriculum designers should integrate ICT as one of the units in each subject which will help the teachers to develop learning materials for each subject.

The government must enhance private Education support in private schools giving financial assistance to buy information technology equipment. The school administration will organize faculty development Plan to ensure that teachers training will be provided to enhance ICT skills in utilization of teaching materials for teachers to uplift their confidence in teaching 21st century learners. The private school's department should conduct workshops and training in the field of ICT in order to prepare the secondary school teachers as digital engineers since the 21st century is knowledge-based technology –driven and fast changing society.
