Abstract— The pandemic ushered in an unprecedented year that brought extreme poverty, the loss of jobs and livelihoods, existential issues for organizations, and other economic upheavals. With the public health concerns and government pandemic mitigation measures, social media's function as a marketing tool was set to grow. The study aimed to determine the significant relationship between the Effectiveness of Social Media Marketing and the Purchasing Involvement of Grade 12 Students. A survey was conducted on 223 randomly chosen participants, which addressed the problem statement and hypotheses. The research used a descriptive-correlational method to describe the variables and determine their correlation. Consequently, the present study concluded that customer engagement was considered a significant aspect of the effectiveness of social media marketing, and purchasing involvement demonstrated that the respondents have particular preferences for purchasing activities. Further, the correlation has shown that the Effectiveness of Social Media Marketing and the Purchasing Involvement of the respondents have a significant relationship. Thus, the researchers suggest considering purchasing involvement as an individual difference variable to understand consumer behavior better.

Keywords— Social Media Marketing, Purchasing Involvement, Customer Engagement, effectiveness, preferences.

I. INTRODUCTION

The COVID-19 pandemic ushered in an unprecedented year that brought extreme poverty, the loss of jobs and livelihoods for millions of people, existential issues for many firms and organizations, border closures, trade restrictions, and other economic and social upheavals. According to the World Health Organization (2020), the pandemic "poses an unprecedented challenge to the world of work." Added to Bradbury-Jones and Isham (2020), the pandemic caused severe psychological, social, and professional changes, including physical and mental health issues, job losses, poor finances, dread of satisfaction, worry during outside visits, and an unclear future. Due to the pandemic, consumers' product demands, shopping and purchasing habits, and post-purchase satisfaction levels all changed. Furthermore, the pandemic has

had an impact on consumer behavior. An analysis conducted by the consulting firm McKinsey and Company found that "the period of contagion, self-isolation, and economic uncertainty has changed the way consumers behave" and that these new consumer behaviors apply to all aspects of life—including how people purchase and consume.

In addition to public health concerns and government pandemic mitigation measures, social media's function and effect as a marketing tool were set to grow. Social distancing became standard practice, and social media provided channels for consumers to engage with people without having physical reach. Moreover, businesses were using social media platforms to broaden their geographic reach to consumers (Gao et al., 2018), strengthen brand assessments (Naylor et al., 2012), and develop stronger relationships with consumers (Rapp et al., 2013). As social media's role has progressed from a standalone marketing tool to a source of digital marketing, it has become increasingly critical for marketing professionals to utilize information effectively to accomplish competitive advantage and superior performance (Lamberton & Stephen, 2016).

Consequently, firms may discover new ways to acquire a competitive advantage by using successful social media marketing tactics (Mason et al., 2020). Due to the effectiveness of social media platforms such as Facebook, Twitter, Instagram, and YouTube across the globe, recent technological advancements have aided entrepreneurship through social networking sites, mobile marketing, and the Internet to spread information about products and services offered. The massive development in the ICT sector enables the vast spread of information around the world, which encourages the growth of newly developed businesses and advances communication between social media users by providing convenient ways to use more than a method to advertise, publicize, or showcase goods, products, and services. Social media as a marketing technique and the anticipated results have a long-term effect on the company's success. (Abbas et al., 2019) businesses may assess and

encourage sustainable company performance through social media marketing platforms. Additionally, social media is critical in long-term marketing strategies that foster the development of good consumer behavior.

Enterprises have made extensive use of social media as a marketing strategy tool. Social networking sites (SNS) are a subset of social media that enable users to interact. SNS may evolve into a medium of reciprocal communication between enterprises and their consumers. Social networking sites can reach various people cheaply (Amina, 2019). Additionally, it has been ingrained in the lives of ordinary people. It is beneficial for businesses to ensure the attractiveness of marketing efforts, increase consumer awareness, and establish online brand communities (Chen, 2019).

According to Ruangkanjanases (2020), businesses or individuals who intend to utilize social media as a marketing medium may offer marketing services, methods, strategies, and concepts that show social responsibility and conform to community criteria. Moreover, marketing material on social media should be commercial and social, including active engagement between users (Ko, 2018), as this develops into deeper communication and positive connections between them (Wang, 2016). Enterprises need help when it comes to creating social media marketing material as they must be able to adapt it to individual consumers or community preferences. As a result, the business must choose the appropriate marketing materials to establish strong connections with consumer behaviors and preferences.

Therefore, this study aimed to determine the significant relationship between the effectiveness of social media and the purchasing involvement of Grade 12 students in one of the private sectarian schools in Cagayan de Oro City, province of Misamis Oriental. The findings of this study would benefit aspiring business professionals and the individuals mentioned in the Significance of the Study, as the researchers believed in the importance of social media marketing, especially during this time of a pandemic.

Statement of the Problem

The study aimed to determine the significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 students in one of the private sectarian schools in Cagayan de Oro City, province of Misamis Oriental. Therefore, the study sought to answer the following questions:

1. What is the level of effectiveness of social media marketing in terms of Customer Engagement of grade 12 students?
2. What is the level of purchasing involvement of the Grade 12 students?
3. Is there a significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 senior high school students?

Hypothesis

The researchers identified one (1) null hypothesis through the study analysis, which was tested at a 0.05 level of significance, as demonstrated below.

Ho: There is no significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 students.

II. METHODOLOGY

This chapter presents the study's setting, research design, respondents' selection and description, research instruments, data-gathering procedure, and statistical techniques.

A. Research Design

The study utilized a quantitative method of research. According to Williams (2011), quantitative research is where the statement of the problem begins with creating research questions or hypotheses, RRL, and analysis of quantitative data. Similarly to defining quantitative research, "plans of inquiry imply surveys and experiments, and data collecting that produce statistical data on instruments are pre-established" (Creswell, 2003; Williams, 2011. p. 18 as cited by Oberiri Apuke, 2017). Gay, Mills, and Airasian (2014) claimed that quantitative research is a data collection and numerical data analysis that explicates, predicts, or controls variables and interests of the phenomena. This research used a descriptive-correlational method as it is appropriate in determining the relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 students. Descriptive research design aims to precisely and thoroughly characterize a population, circumstance, or phenomenon (McCombes, 2019). A descriptive approach is proper to supply facts where precise judgment may be established. Thus, these convey essential information that fulfills the objective of the study.

Bhandari (2021) further stated that correlational research examines connections between variables without altering or influencing them. This study determined whether there was a significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 students.

Ultimately, this study applied numerous procedures to analyze the findings using survey questionnaires and data analysis. Researchers surveyed the participants to gather the necessary information and examine the outcome.

B. Research Setting

This research study was conducted on the target students enrolled in one of the Religious of the Virgin Mary (RVM) schools in Cagayan de Oro City, province of Misamis Oriental.

C. Respondents and Sampling Procedure

The study population focused on the Grade 12 senior high school students of an RVM school in Cagayan De Oro City. The current population size of Grade 12 students is 527. According to Mackey and Gass (2005) and Clark et al. (2013), as cited by Ghahari (2018), descriptive research requires a

minimum sample of 100 respondents, while correlational research requires 50 respondents. Thus, the researchers utilized a Raosoft sample size calculator, which helped arrive at the ideal sample size of 223. The researchers used a population size of 527, a confidence level of 95%, and a margin of error of 5%.

The present study utilized the Simple Random Sampling method, wherein a population sample is chosen at random. Each individual in the population had a precise equal probability of being chosen in this sampling approach. (Thomas, 2020). Therefore, the researcher selected this method to draw statistical judgments about a population as it contributed to the maintenance of strong internal validity and a high degree of external validity as it accurately reflected the features of the broader population (Thomas, 2020).

The participants must be grade 12 senior high school students who were enrolled in one of the academic strands, particularly the Accountancy and Business Management (ABM) strand; Science, Technology, Engineering, and Mathematics (STEM) strand; Humanities and Social Sciences (HUMSS) strand; and Technical-Vocational-Livelihood (TVL) strand offered in one of the private sectarian schools in Cagayan de Oro City, province of Misamis Oriental in the school year 2021-2022, in order to be included in the present study.

D. Research Instrument

The questionnaire was the primary source of data that was conveyed and administered. The researchers utilized fully adopted and adapted survey questionnaires given to the respondents to determine the significant relationship between social media marketing and the price involvement of grade 12 senior high school students. The questions utilized the 5-point Likert Scale, divided into two categories. According to Newson (2021), the Likert scale was one of the most widely utilized sentiment-measuring techniques in scientific and academic research toolsets. The first part of the survey questionnaire had a rating scale of (1) Strongly Disagree, (2) Disagree, (3) Neutral, (4) Agree, and (5) Strongly Agree. While the second part of the survey questionnaire had a rating scale of (1) Never; (2) Rarely; (3) Sometimes; (4) Often; and (5) Always. The first category consists of questions related to the independent variable, and the second category consists of questions concerning the dependent variable. The first category consisted of sixteen (16) questions fully adopted from the study of Shahid et al. (2019) on the effectiveness of social media marketing. The second category consisted of twenty (20) questions adapted from Karaatli's (2015) study on purchasing involvement. Furthermore, the present study's survey questionnaire consists of thirty-six (36) questions.

The respondents' answers to the attitudinal scenarios answered this study's research problem and the data that the researchers acquired through the survey were analyzed.

E. Data Gathering Procedure

Due to the pandemic causing a shift in online learning, it was difficult for the researchers to conduct the survey

questionnaires from classroom to classroom. Instead, the survey was conducted online, wherein the researchers requested approval from the senior high school coordinator and instructors to survey the grade 12 students. Once the instructors and senior high school coordinator had accepted the researcher's authorization to conduct the survey, the researchers approached the respondents to determine whether or not they had consented to participate. The consent letter ensures that any information obtained from participants remains confidential throughout the research. The survey questionnaire will be administered online through Google Forms. The Google forms containing the survey questions will be shared through social media channels, particularly Messenger. After gathering all the information, the researchers compiled and analyzed the data for the study.

F. Statistical Treatment

The researchers utilized the following treatments to analyze the data gathered from the chosen respondents. A descriptive statistics approach was utilized, particularly the central tendency on the first and second research questions. A measure of central tendency is a single number that aims to characterize data collection by finding its center location (Lund Research Ltd, 2018). The mean was calculated to determine the number of repeated checks under the rating scales. As Bhandari (2020) states, descriptive statistics features a data collection that is summarized and organized; a data set is a collection of answers or observations from a sample of a population or the whole population. The researchers utilized an inferential statistical approach for the third research question; specifically Pearson's R. This enabled the researchers to measure the relationship connecting two quantitative variables (interval/ratio) and the level to which the two variables coincided (Allen, 2017), or in this case, determining if there is a relationship between social media marketing and the purchasing involvement of grade 12 senior high school students.

G. Ethical Consideration

Before disseminating the online survey questionnaires, the researchers sent a letter of consent to the Strand Coordinators and teachers, allowing them to conduct their research, collect data, and receive a list of grade 12 senior high school students. They were the study's target population, allowing the researchers to select participants randomly. Following the distribution of the questionnaires, the researchers sought the permission of the selected participants, assuring them that the information they provided would be used only for research purposes and would be kept with the utmost confidentiality. The researchers evaluated the data collected to complete the current study, and the data obtained will continue to be used for research purposes only. The goal of the letter of consent was to follow ethical guidelines and guarantee that all participant information would be kept confidential.

III. RESULTS

This chapter provided the data gathered, the garnered

results, the interpretation of the findings, and the statistical tests examined for hypothesis testing. These are presented with tables and figures following the stated problems regarding the Relationship between the Effectiveness of Social Media Marketing and the Purchasing Involvement of Grade 12 Students.

Research Question No. 1: What is the level of social media marketing effectiveness in terms of Customer Engagement of grade 12 students?

Table 4.1.1 Quality of Content (QC)

Description	M	SD	I
1. I relate to the advertisement I see on social media.	3.49	0.85	High
2. I think advertisements that lack innovation loses the trust of the audience.	3.66	0.95	High
3. I think lucrative visual design helps an advertisement to stand out on social media.	3.87	0.89	High
4. I feel that viral marketing is effective for social media marketing.	3.96	1.03	High
OVERALL MEAN	3.75	0.93	HIGH

The fourth description had the highest mean of 3.96, with a verbal interpretation of High. The given data implied that the respondents felt that viral marketing is effective for social media marketing. As stated by Stonedahl et al. (2010), as cited in Puriwat and Tripopsakul (2021), consumers today mostly rely on word of mouth and advertisements to inform their purchase decisions about a product. Furthermore, the growth in viral marketing increases and builds the awareness of the companies (Kaplan and Haenlein, 2011, as cited in Puriwat and Tripopsakul, 2021). The lowest mean was also 3.49, with

a verbal interpretation of High. The data indicated that the respondents relate to the advertisements they have seen on social media. Advertising has developed from a simple supply of cognitive information to promotion, entertainment, and societal direction throughout time (Philip et al., 2018). Consequently, the overall mean is 3.75, with the verbal interpretation of High expressing that viral marketing is effective for social media marketing as it spreads and highlights the message effectively to the customers.

Table 4.1.2 User Experience (UE)

Description	M	SD	I
5. Social media helps me to gain specific goals and usability.	3.53	0.92	High
6. I use social media for only for social pleasure.	3.17	1.05	Moderate
7. Social media can provide you 100% privacy of my information.	2.69	1.11	Moderate
8. I face embarrassing situation for fake profile.	2.97	1.11	Moderate
OVERALL MEAN	3.09	1.05	MODERATE

The table above shows that the first description garnered the highest mean of 3.53, with a verbal interpretation of High. This meant that social media helped the respondents attain particular goals and usability. Hamari J. et al. (2018) study stated that users can utilize social media as motivational enforcement to help achieve specific goals. However, the lowest mean resulted in 2.69 with a Moderate verbal interpretation, which implied that social media could not guarantee the privacy of the information entirely in the respondents' experience. In the study of Albulayhi and Khediri (2022), users' lack of knowledge and understanding, as well as the lack of relevant resources and architecture of social media

networks, and more so, examine several of the privacy and security issues that social media networks face and the privacy dangers they bring.

On the other hand, the overall mean was calculated to be 3.09, which indicated a Neutral verbal interpretation. The result implied that respondents with user experience in social media helped them with their needs in attaining their goals. Moreover, it was discovered that there is a considerable link between user experience and online accessibility, and e-commerce websites may appeal to the general public by offering accessibility (Aizpurua et al., 2016).

Table 4.1.3 Frequency of Visit (FV)

Description	M	SD	I
9. I spend most of my leisure time on social media.	3.67	1.05	High
10. Checking the social media is the last thing I do before go to bed.	3.78	1.11	High
11. I frequently visit those pages which updates their information regularly.	3.58	0.96	High
12. Loyalty of a customer lies on the frequent visit to the social media page.	3.48	0.95	High
OVERALL MEAN	3.63	1.02	High

Under the frequency of visits, the highest mean score was 3.78, meaning that social media is the last thing respondents check before bed. Udorie (2015) found out that teens, even kids from a secondary school, are so invested emotionally in social media that they wake up at night and browse online to make sure they do not miss out and grow extremely reliant on developing the habit of checking their phone constantly. Furthermore, the lowest mean score was 3.48, with a verbal interpretation of High, which means that

respondents believe that frequently visiting a specific page on social media can reflect customer loyalty. Consumer motives become less significant as habits emerge and site use becomes automated; therefore, patterns differ from motivational determinants of customer behavior, like brand loyalty and brand attitudes (Tam et al., 2009, as cited in Anderson and Wood, 2020). Frequent website users are more engaged (Rishika et al., 2013). Consequently, the overall mean was 3.63, with a verbal interpretation of High.

Table 4.1.4 Customer Engagement (CE)

Description	M	SD	I
13. Daily postings of the products help me for better brand recognition.	3.70	0.99	High
14. Visual presentations like pictures and videos encourage me to learn about the promotional campaign.	3.88	1.01	High
15. Quick responses in social media makes me more comfortable to make the purchase decision.	3.91	0.95	High
16. Social media is the best option for fast and effective feedbacks.	3.82	0.97	High
OVERALL MEAN	3.83	0.98	HIGH

The findings of descriptive statistics indicated that customer engagement had the highest mean score of 3.91, with a verbal interpretation of High. This explains that having quick responses makes the purchase decision more comfortable. According to Berkowitz in Tjiptono (2018), purchasing decisions are the processes purchasers go through to determine the items and services to be acquired. The study by Wursan et al. (2021) concluded that communication through social media might effectively affect purchase decisions. On the contrary, a mean of 3.70 was the lowest score with a verbal interpretation of High, which means that the respondents recognized the brand better with the help of daily postings of the products of a particular brand. According to Hutter et al. (2013), consumers might perceive a need by satisfying content on social media that stimulates them to purchase. Products or brands are discovered by consumers who can be emotionally attracted by their content, resulting in

a purchase intention response (Magrath & McCormick, 2013). Accordingly, the overall mean was 3.83, which implied that engaging and responding with customers can create comfortable and deep relationships in their purchase decisions. Farook and Abeysekara (2016) conducted a study to determine the effect of online media marketing on customer engagement. The authors observed that although associations' expenditure on web-based media continues to grow, evaluating its impact remains challenging for most organizations. The analysis indicated that social media platforms promote active long-distance interpersonal connections by facilitating dynamic communications between companies and consumers and facilitating user participation. Therefore, an improved brand and consumer connection online will ultimately influence purchasing behavior.

Table 4.1.5 Summary Results of the Effectiveness of Social Media Marketing

	M	SD	I
Quality of Content	3.75	0.07	High
User Experience	3.09	0.08	Moderate
Frequency of Visits	3.63	0.07	High
Customer Engagement	3.83	0.02	High
OVERALL MEAN	3.59	0.06	HIGH

The overall mean score among the descriptions garnered a calculation of 3.59, which is the verbal interpretation of High. Furthermore, the study of Barger et al. (2016) discovered that the engagement of customers with businesses and their particular social network pages demonstrated the efficacy of social media as one of the key aims of businesses on social media platforms is to communicate with consumers with their brand. In the study of Farook et al. (2016), media and content types of postings significantly influence consumers' online engagement, and the more effective social media marketing is,

the higher the level of customer engagement. With that, the study stressed the need for self-disclosure as a critical component of developing deep relationships between individuals, as improved brand and consumer connection online will ultimately influence their purchasing behavior.

Research Question No. 2: What is the level of the purchasing involvement of the Grade 12 students?

Table 4.2.1

Purchasing Involvement

Description	M	SD	I
17. I have to consider as many alternatives as possible in order to make sure I get the best product.	4.18	0.81	Often
18. I think that when shopping for a new product, deciding which alternative to buy is an involved process for me.	4.01	0.84	Often
19. I prefer to visit as many stores as possible to make sure I am getting the best buy.	4.04	0.96	Often
20. I think that the decision about which product alternative to buy requires a lot of thought.	4.16	0.81	Often
21. I think that being a smart shopper is worth the extra time it takes.	4.28	0.84	Always
22. I think that it is part of my value system to shop around for the best buy.	4.07	0.88	Often
23. I am willing to spend extra time shopping in order to get the cheapest possible price on goods of like quality.	4.05	0.96	Often
24. I would care which one I buy when selecting from many types and brands of a certain product available in the market.	4.09	0.86	Often
25. I am concerned about the outcome of my choice when making my selection of a product.	4.18	0.87	Often
26. I choose products very carefully.	4.38	0.82	Always
27. It makes sense to get upset over a purchase decision since most brands are about the same.	3.65	1.02	Often
28. I think that consumer reports are very relevant to me.	4.22	0.84	Always
29. I prefer to take my time and make sure I am getting the best value even with small purchases.	4.30	0.84	Always
30. I am interested in bargain seeking.	3.74	1.02	Often
31. I am interested in sales.	4.26	0.85	Always
32. I can save a lot of money by careful shopping.	4.24	0.87	Always
33. I am usually annoyed when I find out I could have bought something cheaper than I did.	4.01	0.97	Often

34. I have an interest in shopping.	3.88	1.06	Often
35. I get excited about sales and promos.	4.19	0.90	Often
36. I think that when I shop, I spend more time shopping than the average person.	3.58	1.12	Often
OVERALL MEAN	4.08	0.91	OFTEN

Under purchasing involvement, the highest mean score totaled 4.38 with a verbal interpretation of Always, which means the respondents are cautious when choosing the products they purchase. The measure of a person's physical and mental effort in making a buying choice is through involvement (IvyPanda, 2019). Schiffman and Hansen (2011) stated that involvement instills a sense of significance in the product or service offering, prompting the customer to gather and evaluate pertinent information about the product before making a purchase choice and, as a result, affects both the consumer decision-making process and the process of searching for, processing, and delivering information. Furthermore, the overall mean score among all the descriptions garnered 4.08 with a verbal interpretation of Often. The study of Karaatli (2015) revealed that purchasing involvement implies that customers have particular inclinations and preferences about purchase decisions and shopping involvement in general. Purchasing involvement as an individual difference variable can assist in understanding a component of the variance in the data in studies examining consumer decision-making and shopping behavior despite the importance of situational variables. Further, purchasing involvement is stable across various products and circumstances and may be utilized for segmentation as a lasting individual difference characteristic.

Research Question No. 3: Is there a significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 senior high school students?

Table 4.3.1 The Correlation Summary Result on the Effectiveness of Social Media Marketing and the Purchasing Involvement of Grade 12 Senior High School Students

	Column 1	Column 2
Effectiveness of Social Media Marketing	1	
Purchasing Involvement	0.56	1

Table 4.3.1 demonstrates the correlation between the effectiveness of social media marketing and the purchasing involvement of grade 12 senior high school students. The researchers used an inferential statistical approach, particularly Pearson's R. This enabled the researchers to determine and

assess the relationship connecting two of the quantitative variables (Allen, 2017), or in this case, social media marketing and the purchasing involvement of grade 12 senior high school students. As shown in the table above, the findings resulted in a correlation coefficient 0.56 with a qualitative description of Moderately High.

Hypothesis Testing

One (1) null hypothesis was identified through the study analysis tested at a 0.05 significance level. The researchers performed the t-test (two-tailed) to determine the p-value. The null hypothesis would not be rejected if the computed p-value was more significant than 0.05. Otherwise, it would be rejected if the calculated p-value was less than 0.05. The researchers also used the Social Science Statistics Calculator to confirm the results.

The Formula for t-test for the Correlation Coefficient:

$$t = r \sqrt{\frac{n - 2}{1 - r^2}}$$

Ho: There is no significant relationship between the effectiveness of social media marketing and the purchasing involvement of Grade 12 students.

Using the formula above, the analysis resulted in a p-value of .00001, less than the significance level of 0.05. Therefore, the null hypothesis of “no significant relationship between the effectiveness of social media marketing and the purchasing involvement of the grade 12 Senior high school students.” was rejected. Consequently, there were insufficient related studies to support this claim. However, in the study of Pütter (2017), it was discovered that the growing use of social media worldwide has led to the notion that it is a valuable tool for supporting consumer involvement.

Table 4.3.2 Summary Results of the Hypothesis Testing

Null Hypothesis	Coefficient (r)	P-value (two-tailed)	I
There is no significant relationship between the Effectiveness of Social Media Marketing and The Purchasing Involvement of the Grade 12 Senior high school students.	0.5595	0.00001	REJECT

IV. CONCLUSION

Based on the results and findings that have been drawn from the study, the following conclusions were formulated:

1. Customer Engagement is considered a significant aspect of the effectiveness of social media marketing. The researchers were able to determine the effectiveness of social media in terms of customer engagement through three determinants: quality of content, user experience, and frequency of visits. Thus, the effectiveness of social media as a marketing tool demonstrates how social media greatly influences customer engagement and allows businesses to provide good quality content on social media to stimulate potential customers to purchase (Magrath & McCormick, 2013). Moreover, there is more engagement among customers through the improvement of branding and building relationships to develop trust in creating a customer-oriented product (Farook & Abeysekara, 2016; Hill et al. 2003, cited in Khadka, K., & Maharjan, S., 2017).
2. The purchasing involvement demonstrated that the respondents have particular patterns and preferences towards purchasing and shopping activities. There is a high level of purchasing involvement among grade 12 senior high school students, thus increasing their physical and mental effort in carefully making purchasing choices. The respondents who were very engaged with purchases varied from those who were less concerned with purchases in their buying behavior. Moreover, the respondents who were more interested in their purchases spent more time shopping. This indicated that purchasing involvement as a variable may contribute to a more profound understanding of consumer behavior (Karaatli, 2015).

The correlation has shown that the Effectiveness of Social Media Marketing and the Purchasing Involvement of Grade 12 Senior High School Students have a significant and positive relationship. Given the significance level, the researchers rejected the null hypotheses. Consequently, in the study of Pütter (2017), it was discovered that the growing use of social media worldwide has led to the notion that it is a valuable tool for supporting consumer involvement.

V. RECOMMENDATIONS

The following includes recommendations from the researchers based on the conclusions:

1. The researchers suggest that future researchers consider purchasing involvement as an individual difference variable as it deserves greater emphasis on understanding consumer behavior.
2. Since the researchers only proposed Customer Engagement with its three determinants, namely, Quality of Content, User Experience, and Frequency of Visit, the researchers recommend that future

researchers include and consider other determinants of social media as a marketing tool and variables that significantly influence its effectiveness.

Due to the given time constraints, the collected data mainly focused on Grade 12 senior high school students from the ABM, STEM, HUMSS, and TVL strands. Thus, the researchers would like to recommend conducting a study with the same variables but considering a larger population to acquire more precise data, assess factors accurately, and become more accessible to a broader range of individuals.
